B+LNZ Genetics Central Progeny Test

B+LNZ Genetics Central Progeny Test (CPT) currently involves over 200 rams, across eight sites. The benchmarks created by this test underpin NZGE – the weekly large-scale across-flock and across-breed evaluation.

In 2016, the test's focus was adjusted further towards more commercial hill country environments (where most of New Zealand's sheep flock are now farmed) and – in partnership with industry – “Next Generation” flocks were introduced.

Progressive Meats, Horizon Farming and B+LNZ Genetics established a Next Generation site to compare the performance of various terminal rams' offspring under commercial farming conditions.

Progeny are monitored for growth rate, before being processed and measured for eating quality and yield through Progressive Meats' grading system. Now the revised Meat Module is fully implemented, results are fed directly into the New Zealand Genetic Evaluation (NZGE).

Acknowledgements

The progeny test at Maraetotara is a partnership between Progressive Meats Ltd, Horizon Farming and B+LNZ Genetics.

Industry partners: AbacusBio, AgResearch, Aimee Charteris Genetics.

Sponsors: Rams used at the Maraetotara site are insured by FMG at no cost.

For more about the progeny test visit: www.blznzgenetics.com/progeny-tests

The results table explained

- All values are sourced from the NZGE Single Step run 15 Feb 2019.
- NZ Terminal Worth (NZTW) is comprised of Terminal Sire Survival (TSS), Terminal Sire Growth (TSG) and Terminal Sire Meat Yield (TSM)
- Across flock values are benchmarked values and valid to compare across flocks. A number of sires do not have across flock values as there was insufficient data collected on the home flock for benchmarking. The “Within flock” values have been provided to allow those animals to view some of their results, but it is not a valid comparison across flocks.
- The IMF research breeding value (IMF rBV) is derived from hyperspectral or near infra-red imaging methods in plant. In order to accurately compare across collection years these values need to be calibrated with wet chemistry intramuscular fat values on 10% of the samples. This will not be completed until July 2019. In the meantime, preliminary IMF research breeding values have been provided – but are to be used with caution.
- In accordance with the ram supply agreement, all submitted rams (in order of Terminal Worth) have been reported.
